

Three countries. Different trajectories.

A health ministry analyst needs to know what was proposed, what was funded, and which assumptions deserve testing.

Life expectancy at birth · 2024

From a country to an analyst brief.

01 Choose a country

Observed outcomes and population context, with dates and sources.

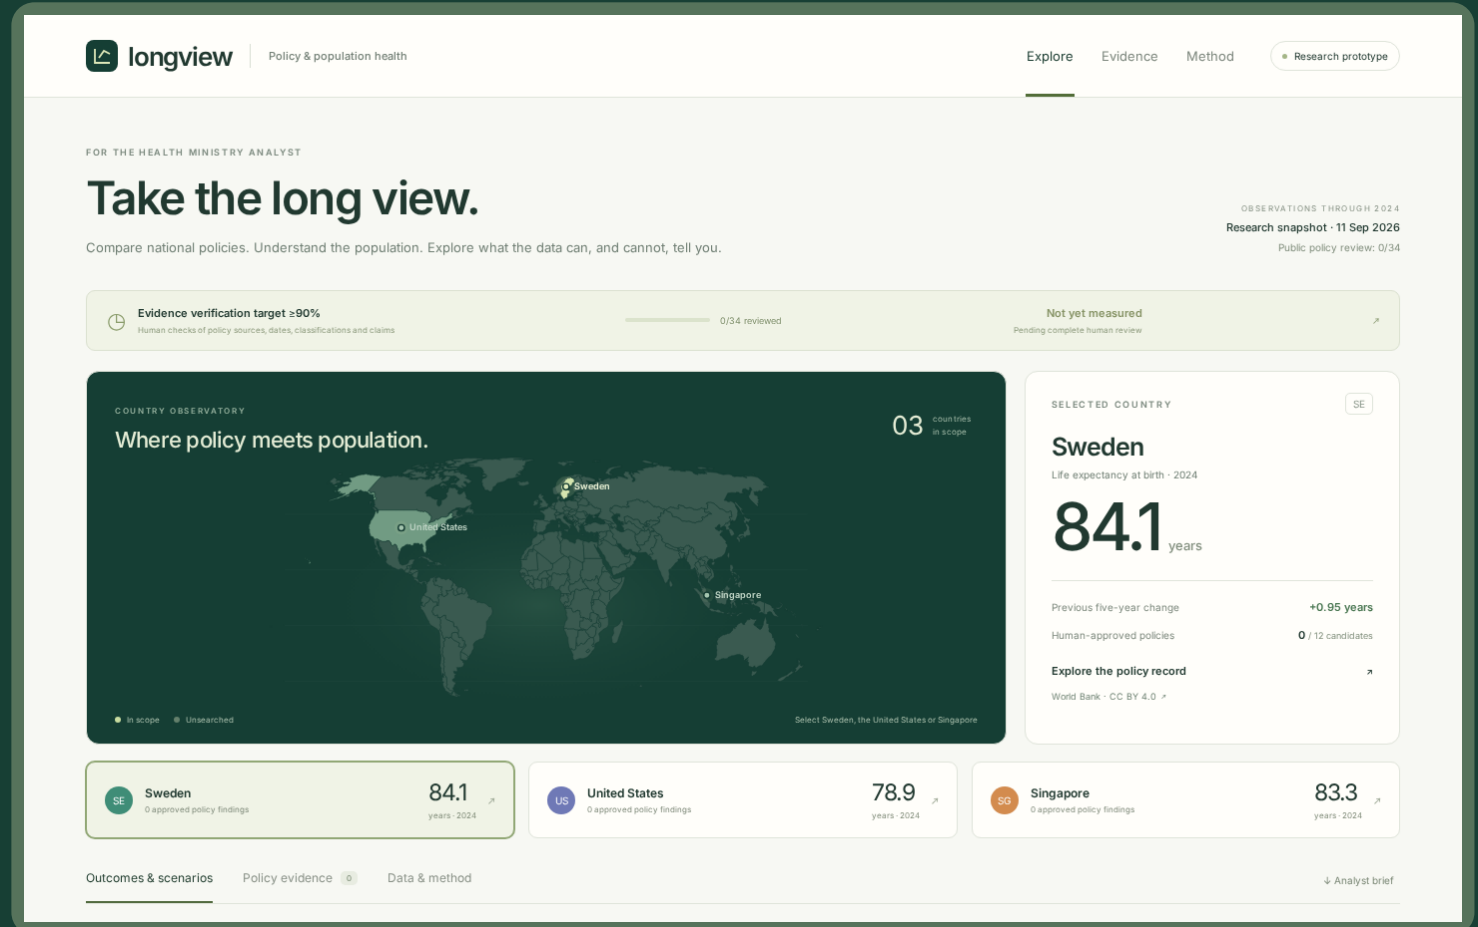

02 Inspect the policy record

Separate proposals, adopted rules and funding commitments.

03 Change one assumption

Five-year forecast; ten-year scenario. Share the link and print the brief.

36 candidates · 0 human-approved

Make the uncertainty part of the decision.

FIVE-YEAR HISTORICAL FORECASTS

1.10 years mean absolute error

Regression		1.10
No change		1.23
Previous trend		1.28

1,098 tests · 183 training countries / economies

HUMAN EVIDENCE VERIFICATION

≥90% required initial sample pass rate

0 / 34 reviewed · Not measured

Source, date, classification and claim.
The initial sample is frozen before correction.
Unapproved claims stay out of the public release.

Known failure: US error 1.95 years vs 0.91 for no change. Wider interval coverage: 74.9% (90% target).

Next pilot: test analyst interpretation and review comparable fundamental-ageing research funding. Team: Selja · Max · Jan.
